

This page describes; it does not explain. Everything here is measured, but none of it shows that AI caused what you are looking at. Other things moved over the same years: interest rates, a pandemic, the ordinary business cycle. Read the dates, not the sheet's date: the sheet is generated on demand, the evidence is not, and every figure carries its own vintage.

FOUR QUESTIONS, MEASURED SEPARATELY

SWEDEN IN DEPTH: HOW OFTEN DO JOB ADS ASK FOR AI?

A range, not a single number: the upper line counts an advertisement that mentions an AI skill anywhere, the lower one only when the skill is asked of the person being hired. Both rose steeply. The broader count went from 0.05% of advertisements in 2006 to 1.09% in 2025, about 22 times as high, and the honest 2025 range is 0.55% to 1.36%.

Right now (8 Aug 2026): of the 33,655 most recent advertisements, 1.64% mention an AI skill and 0.81% ask for one in the job itself. This is the only figure on the sheet that moves daily.

How capable are AI systems?
12-17h

the longest human-expert tasks frontier AI agents complete at even odds; the length has been doubling every 4-6 months. This is the technology the four questions are read against, not a fifth question about the labour market.
METR · May 2026

Before you quote this. The Swedish series counts what employers write down when hiring: not jobs, and not firms using AI, two of the panels above. Not all hiring is advertised. A rising line means only that employers ask for AI skills more often.

WHERE THE DEMAND ACTUALLY SITS

Swedish occupations, 2025, ranked by the share of their advertisements asking for AI

JobTech / Platsbanken job ads (CC0), frozen v1.3 term list, distinct advertisements

OBSTACLES FIRMS NAME

Per cent of all firms with 10+ employees, 2025

Shares are of ALL firms, not of non-adopters, so they do not sum to anything. Sweden is below the EU on every barrier, which is what a high-adoption country looks like. Not comparable with 2021: Eurostat flags a break in the Swedish series.

One entry is a measurement artefact worth naming: medical secretary (medicinsk sekreterare) appears because those advertisements mention speech-recognition software, which our classifier judges to be a tool the job uses rather than an AI skill it asks for.

WHAT THIS CANNOT SEE

- No task-level data. We see what employers write in advertisements, not how work is actually done, nor how tasks and responsibilities shift inside a job that keeps its name.
- Not all hiring is advertised. This is the advertised margin. Occupations that hire through networks or internal moves are under-represented, and that varies by sector.
- One job board. Platsbanken is large and stable but it is not the whole market, and its reach has fallen somewhat relative to surveyed vacancies since 2006.
- Validated on one year. Precision and recall are measured on 2024 advertisements. An early-period check covering 2006 to 2013 is drawn and not yet done.
- Exposure is not displacement. The exposure measure on page one describes tasks AI could affect. It is not a prediction that anyone loses work.
