

AI and the labour market

What the evidence shows, internationally and for Sweden in depth

This page describes; it does not explain. Everything here is measured, but none of it shows that AI *caused* what you are looking at. Other things moved over the same years, including interest rates, a pandemic and the ordinary business cycle. **Read the dates, not the sheet's date:** the sheet is generated on demand, the evidence is not, and every figure carries its own vintage.

FOUR QUESTIONS, FOUR DIFFERENT ANSWERS

■ Sweden ■ international comparison

Could AI do parts of the job?

Share of jobs in the quarter of occupations most exposed to generative AI. Exposure means a task could be affected, not that anyone has lost work.

DAIOE genAI v2023 · EU-LFS

Are employers asking for it?

Share of job advertisements that require an AI skill. Still a small slice of all hiring, but growing fast: see the Swedish series below.

AI Index / Lightcast · 2025

Are firms actually using it?

Share of firms using AI in 2025. Across the EU this was 8% in 2023, so adoption has more than doubled in two years.

Eurostat · 2025

Has it shown up in pay?

Real wage growth 2015–2025 in US occupations, by exposure. Pay grew more slowly where exposure is highest. In Sweden it is flat in every group.

BLS OEWS · SCB · real terms · 2015–2025

SWEDEN IN DEPTH: HOW OFTEN DO JOB ADS ASK FOR AI?

Every advertisement on the public job board

We report a **range** rather than a single number, because it depends on how strictly you count. The upper line counts an advertisement whenever it mentions an AI skill anywhere, including the blurb about the company. The lower line counts it only when the skill is asked of the person being hired. Both have risen sharply: the broader count went from 0.05% of advertisements in 2006 to 1.09% in 2025, about 22 times higher. For 2025 the honest range is **0.55% to 1.36%**.

Right now (8 Aug 2026): of the 33,655 most recent advertisements, 1.64% mention an AI skill and 0.81% ask for one in the job itself. This is the only figure on the sheet that moves daily.

How fast is the technology moving? 12–17h

the longest human-expert tasks frontier AI agents complete at even odds; the length has been doubling every 4–6 months. This is the technology the four questions are read against, not a fifth question about the labour market.

METR · May 2026

One thing worth knowing before you quote this. The Swedish series counts what employers *write down when hiring*. It is not a count of jobs, and it is not a count of firms using AI; those are two of the panels above, and they are different things measured different ways. Not all hiring is advertised either. So a rising line means employers ask for AI skills more often than they used to, and nothing more than that.
