# AI and the labour market

What the evidence shows, internationally and for Sweden in depth

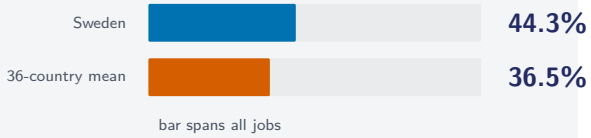

**This page describes; it does not explain.** Everything here is measured, but none of it shows that AI *caused* what you are looking at. Other things moved over the same years: interest rates, a pandemic, the ordinary business cycle. **Read the dates, not the sheet's date:** the sheet is generated on demand, the evidence is not, and every figure carries its own vintage.

## FOUR QUESTIONS, MEASURED SEPARATELY

Sweden · international comparison

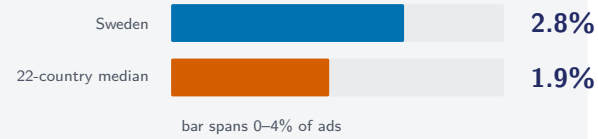

### How exposed are jobs to AI?

Jobs in the most AI-exposed quarter of occupations. Exposure describes applicability, not who loses work.

Source: DAIOE generative-AI composite (g2gen) v2025 · EU-LFS 2025

### How often do employers ask for AI skills?

Advertisements asking for an AI skill: a small part of hiring. The Swedish series in the figure below is stricter and reads lower.

Source: AI Index / Lightcast · 2025

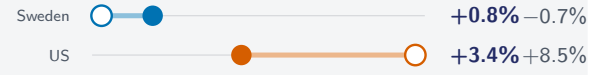

### How many firms use AI?

Firms with 10 or more persons employed, 2025; the tick marks the 2024 wave. Smaller firms are not in this survey.

Source: Eurostat · 2025

### What has happened to pay?

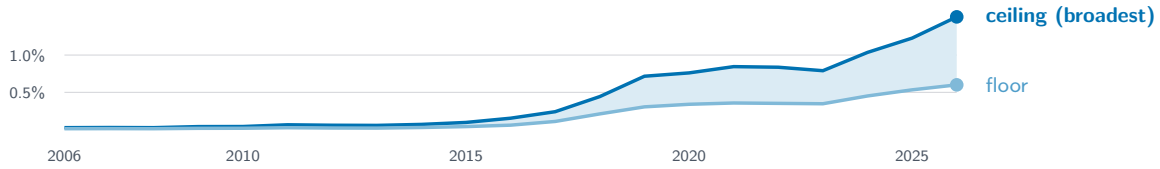

Real wage growth by exposure, most exposed in bold. No Swedish gap; the US gap runs the other way.

Source: SCB · BLS OEWS × DAIOE g2gen v2025 · real terms · SE 2014–2025, US 2015–2025

## SWEDEN IN DEPTH: HOW OFTEN DO JOB ADS ASK FOR AI?

Every advertisement on the public job board

A **range**, not a single number: the floor counts an advertisement only when an AI skill is asked of the person hired; the ceiling adds AI terms anywhere and the hand-read share of ads that only say "AI". Ads naming an AI term went from 0.03% of advertisements in the pooled 2006–2008 base to 1.05% in 2025, about 40 times as high, and the 2025 range is **0.53% to 1.23%**. Both lines rest on a term list and cover only the AI demand that words reveal.

Right now (13 Oct 2026): of the 37,010 most recent advertisements, 1.41% name an AI term and 0.81% ask for one in the job itself. This is the only figure on the sheet that moves daily.

JobTech / Platsbanken job ads (CC0), frozen v1.7 term list, distinct advertisements

### How capable are AI systems?

**12–17h**

at 50% success

the longest human-expert tasks frontier AI agents complete; the length has been doubling every 4–6 months. This is the technology the four questions are read against, not a fifth question about the labour market.

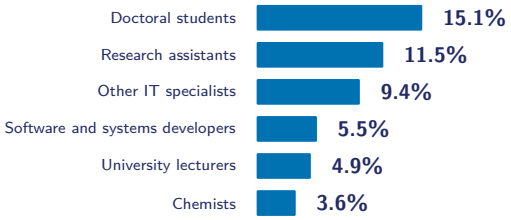

METR · May 2026

**Before you quote this.** The Swedish series counts what employers *write down when hiring*: not jobs, and not firms using AI, two of the panels above. Not all hiring is advertised. A rising line means only that employers ask for AI skills more often.

## WHERE THE DEMAND ACTUALLY SITS

Swedish occupations, 2025, ranked by the share of their advertisements asking for AI

### Asks most often

### And in none of these

**0.0%** Registered nurses (15,842 ads)

**0.0%** Personal care assistants (14,946 ads)

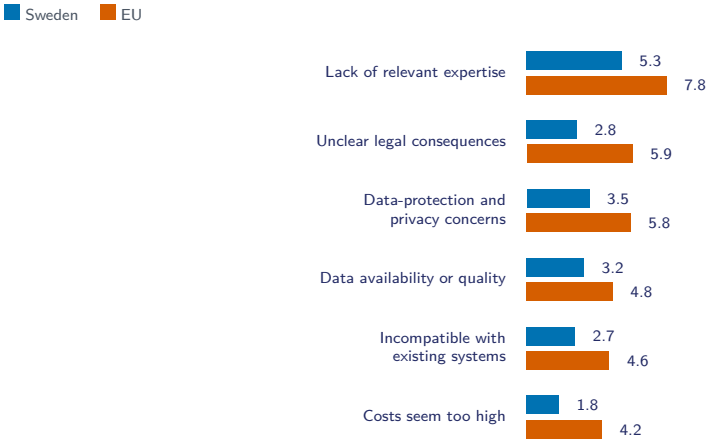

**0.0%** Assistant nurses, home care etc. (8,607 ads)

These are among the largest occupations on the board. The demand is real and it is concentrated: most of the labour market is not being asked for AI at all.

JobTech / Platsbanken job ads (CC0), frozen v1.7 term list, distinct advertisements

## OBSTACLES FIRMS NAME

Per cent of all firms with 10+ persons employed, 2025

Shares are of every firm in the survey, not of non-adopters, so they do not sum to anything. Sweden is below the EU on every barrier, which is partly mechanical: the more firms already use AI, the fewer are left to be asked why they do not. Not comparable with 2021: Eurostat flags a break in the Swedish series.

## IN THE EMPLOYERS' OWN WORDS

Advertisement headlines, as written

**Most common: 2026 · H1** Machine learning engineer · Data scientist

### New titles appearing

AI ambassador (2023) · AI content producer (2023) · AI-experter / AI experts (2024) · AI lead (2025) · AI data annotation specialist (2025) · Senior agentic AI developer (2026)

### Titles that stopped clearing the bar

Telemarketer (2018) · Construction engineer (2022) · Mathematical statistician (2023) · Inside sales (2024) · Network technician (2024)

One entry is a measurement artefact worth naming: medical secretary (medicinsk sekreterare) appears because those advertisements mention speech-recognition software, which our classifier judges to be a tool the job uses rather than an AI skill it asks for.

## WHAT THIS CANNOT SEE

**No task-level data.** We see what employers write in advertisements, not how work is actually done, nor how tasks and responsibilities shift inside a job that keeps its name.

**Not all hiring is advertised.** This is the advertised margin. Occupations that hire through networks or internal moves are under-represented, and that varies by sector.

**One job board.** Platsbanken is large and stable but it is not the whole market, and its reach has fallen somewhat relative to surveyed vacancies since 2006.

**Validated on one year.** Precision and recall are measured on 2024 advertisements. An early-period check covering 2006 to 2013 is drawn and not yet done.

**Exposure is not displacement.** The exposure measure on page one describes tasks AI could affect. It is not a prediction that anyone loses work.

AISCAF WASP—HS Hard to read? Every figure is on the web page as selectable text at any zoom, with the numbers as CSV: ai-econlab.com/monitor. AI-Econ Lab, Örebro University and the Ratio Institute. Örebro University is one of the three nodes of AISCAF, a research cluster financed by WASP-HS, which funds part of the lab's team. Public data throughout; every figure is reproducible from the source beside it. Method: ai-econlab.com/monitor/methods.
